

ABSTRACT OF THE DISCLOSURE

A drawer-type mobile phone includes a main body provided with a microphone; a drawer cover slidably movable linearly, having a panel form so as for both margins to be moved along both side faces of the main body; a speaker
5 mounted at the upper inner surface of the drawer cover, being connected with an audio amplifier of the main body through a connection member; an antenna movably connected with a tuner terminal of the main body and mounted in a manner of being able to interwork with the drawer cover; and an operating unit for
10 moving the drawer cover by one touch. The drawer cover has a transparent window at the position corresponding to an LCD part of the main body and is formed in a panel form so that both margins thereof can be movable along the both side faces of the main body.
